

(a) Unrestricted ambiguity

Trajectory agreement alone
does not identify the delay
in the unrestricted class.

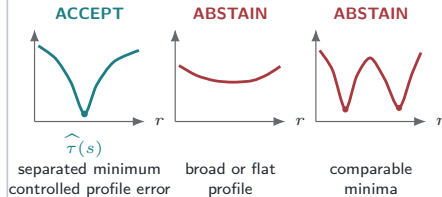

(b) Projective recovery

$r \mapsto \text{span}\{w_s(r)\}$ injective on I_{τ}
 $\implies \tau(s)$ identifiable for the fixed
 matched-slope inverse problem.
 $M \geq 3$ when both offset
 and nonzero gain are unknown.

(c) Certification and abstention

empirical profile $P_s(r)$

Separated minimum with
controlled error supports
certified recovery; otherwise abstain.
